JalDrishti — Frontend Plan

Clean, Human-Designed UI & Smooth Animations Guide | **For Bhavika**

1. The Core Design Vision: 'Human, Clean & Impressive'

Our goal is to make the dashboard look like a **real, modern, world-class product** (inspired by studios like *Cuberto*, *Linear*, and *Stripe*) — **NOT** an over-cluttered, neon 'AI-generated' demo.

What We AVOID (Looks AI-generated):	What We BUILD (Cuberto / Human Feel):
• No harsh neon rainbow glows everywhere. • No fake sci-fi buzzwords or busy charts. • No jarring, instant color changes. • No cramped, unreadable fonts.	• Clean dark slate background (#0a0f1d / #0f172a). • Smooth micro-interactions & buttery easing. • Crisp, readable cards with gentle borders. • Calm, confident, and intuitive hierarchy.

2. Animation Tools & Inspiration (The 'Cuberto' Vibe)

Instead of heavy libraries, use lightweight, standard tools that give maximum elegance with minimum code:

- **Framer Motion:** For smooth card enters, tab transitions, and animated number tickers.
- **Smooth Cubic-Bezier Easing:** Use cubic-bezier(0.16, 1, 0.3, 1) for all hover effects. It feels organic and springy, exactly like high-end agency designs.
- **Lucide React Icons:** Crisp, clean, minimalist SVG icons (no heavy blurry icon packs).
- **Leaflet Animated Trajectories:** Smooth dotted marching lines showing ship tracks moving toward the origin.

3. Step-by-Step Tasks for Tomorrow (Straightforward Checklist)

Step 1: Top Bar & Region Badge

Keep it clean and uncluttered. Show the Incident ID in a subtle mono font tag, a green pulsing dot for 'Live Ingestion Online', and a clean 'Run Investigation' button with a subtle hover lift.

Step 2: 4-Stage Stepper (Clean Sequential Flow)

Instead of all 9 steps flashing at once, make the active step have a soft blue pill indicator. When 'Run Pipeline' is clicked, steps transition with a smooth 0.3s delay.

Step 3: Central Leaflet Map Elevation

• Use CartoDB Dark Matter tiles (already looks clean).
• Make the oil slick polygon have a subtle semi-transparent ocean gradient.
• Add a gentle radar ring ping on the origin zone.
• Highlight the culprit vessel track in amber/red with an animated flowing dash.

Step 4: The Showstopper — Top 3 Culprits Card

This is where anyone opening the site gets impressed:
• **Card #1 (Highest Culprit):** Featured at top with an 87% Match badge, Vessel Name (MT AZURE HORIZON), ship type, and 3 clear forensic evidence bullet points.
• **Cards #2 & #3:** Smaller, calm secondary cards (12% and 6%) showing why they were cleared.
• **Hover effect:** Hovering any ship card highlights that ship's path on the map.

Step 5: Satellite Properties Inspector (Simple & Clear)

A clean 2-column key-value grid: Centroid (Lat/Lon), Slick Area (18.4 km²), Perimeter, and Confidence (91%). Clean numbers, no unnecessary charts.

Step 6: Timeline Scrubber (Drift Animation)

When moving the slider from 0h to 48h, the slick polygon smoothly transitions and expands along the ocean drift vector.

4. Copy-Paste Code Helpers for Bhavika

Add this smooth easing curve to tailwind.config.js or index.css for instant Cuberto-style feel:

Summary for Tomorrow: Build step-by-step, test the Top 3 Culprits card first, keep colors balanced (dark slate + ocean blue), and focus on smooth hover transitions. That alone will look extremely premium!
